

ASSIGNMENT 1

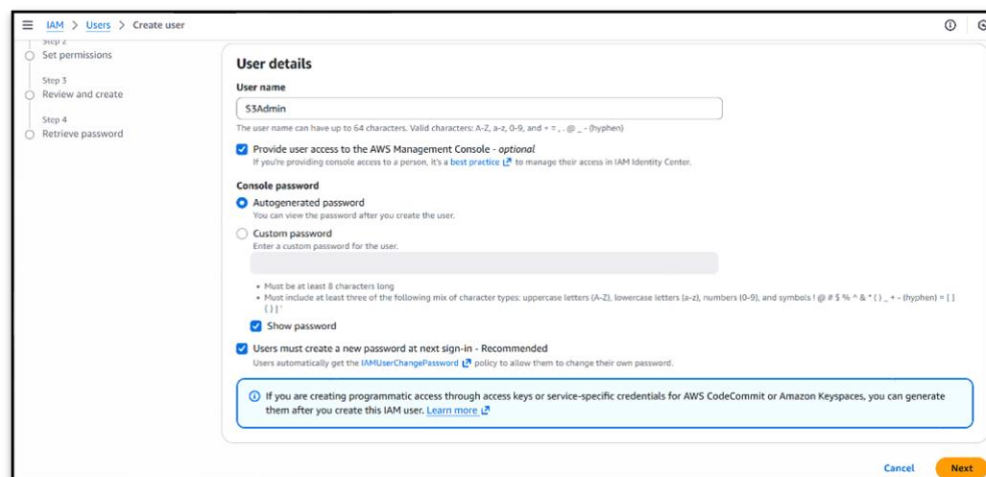

Task 1:

To create an IAM account to have full access to S3 services:

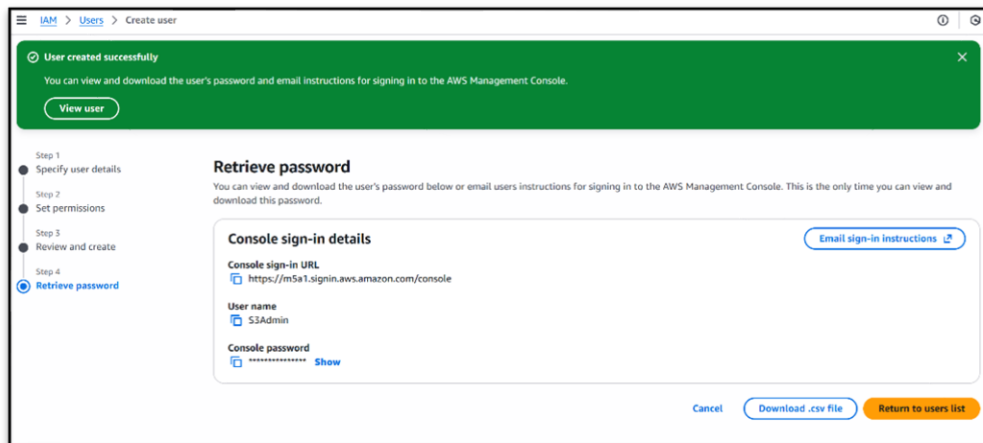

- Open the AWS Console and go to IAM→If using for an organization of various branches groups can be used else select 'Users' from the left pane.

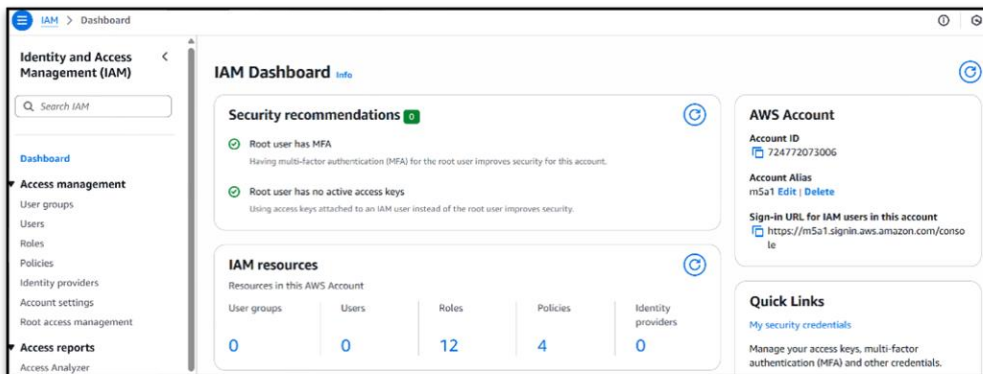

- Create user→Provide user access to manage their work→Auto-generate password or you can give your preferred password→Next.

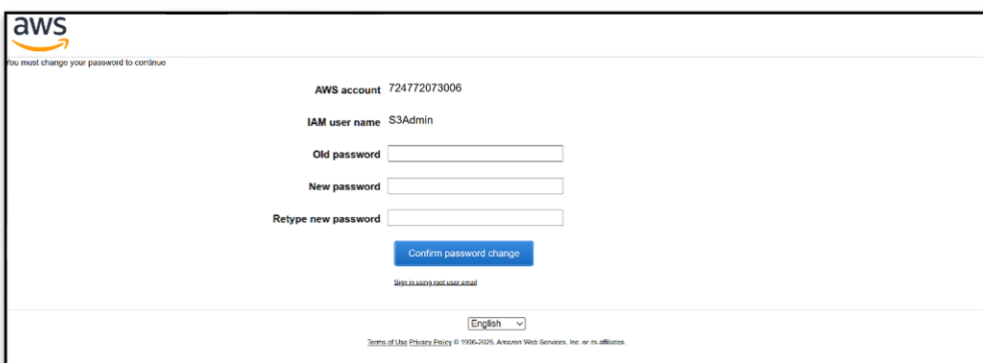

- Set permissions: Attach policies directly→Search and select the Amazon S3 Full Access policy or Create your own policy→Next→Review the policies→Create User→Remember the password or you can choose the option of downloading the csv file.

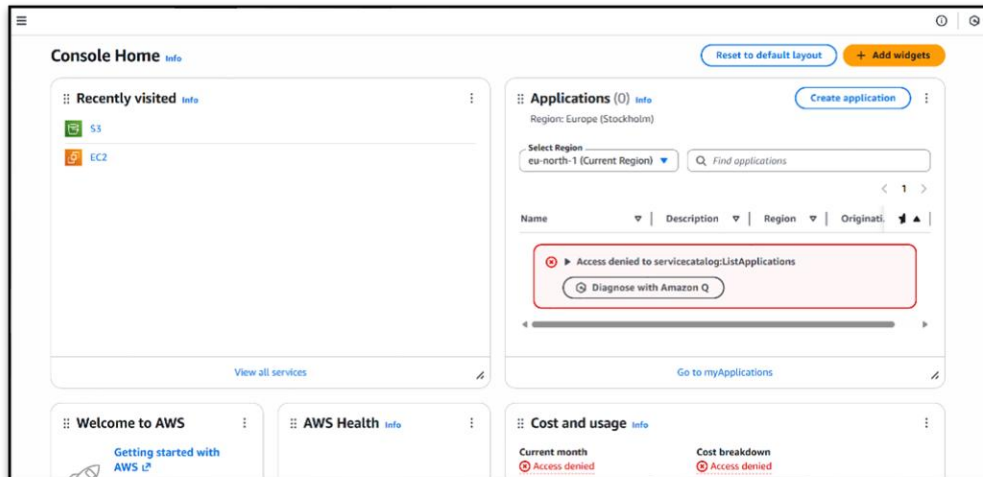

- **Setting up custom sign-in URL:** Navigate to the dashboard → You can find the account id there where you can get the option of adding or editing the alias for the account → Use or share the Sign-in URL for the IAM user to login into the console.

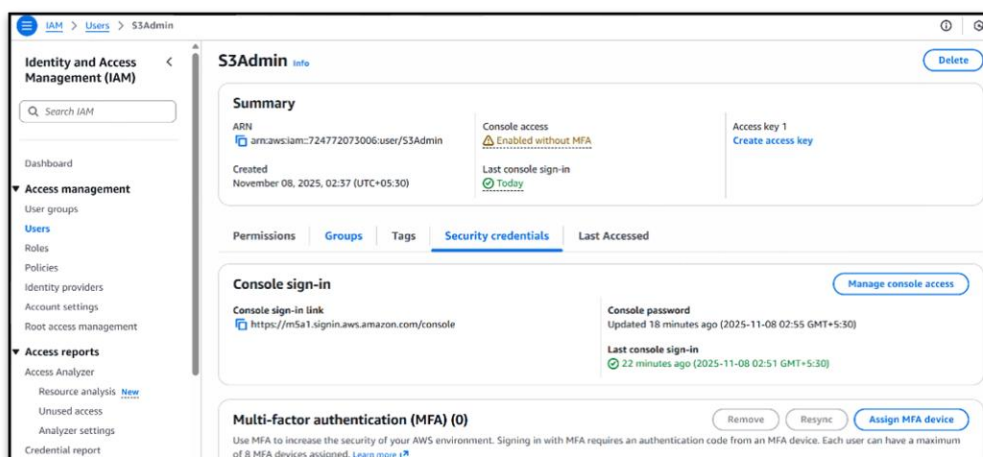

- In the top right bar click on the option of 'add session' → Enter the account Id or alias → IAM username → Password → You would be directed to a window where the new password is to be set → Confirm password changes.

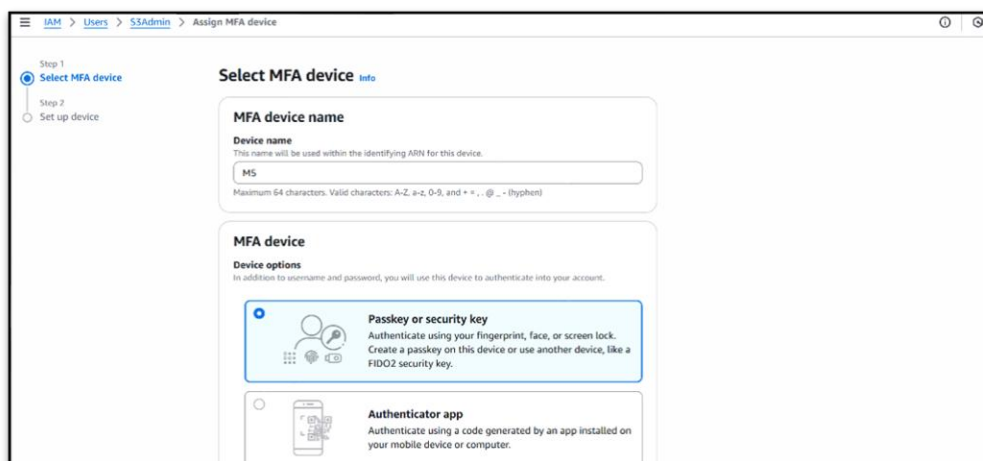

- You would be logged in successfully where you can find that the access for all other services would be denied except Amazon S3 for which full access is provided.

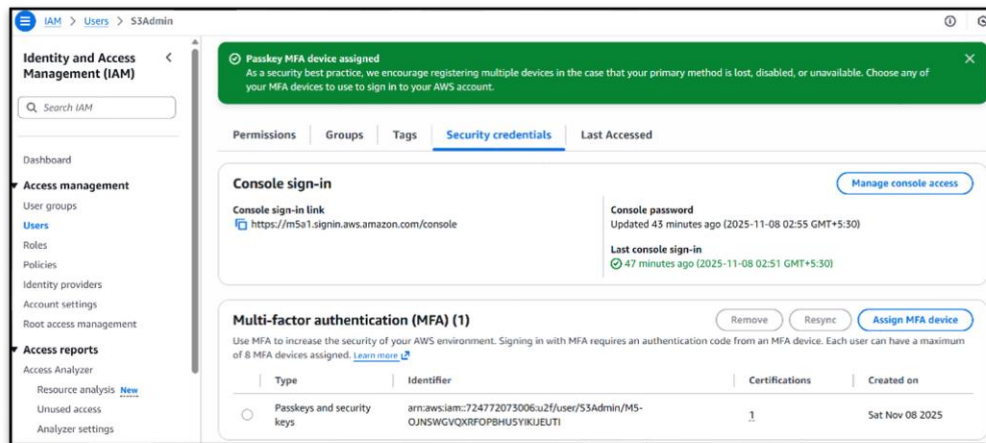

- **Setting up MFA:(Multi-Factor-Authentication)** In the root account go to the Users→Select the user created→Security credentials→MFA→Assign MFA device.

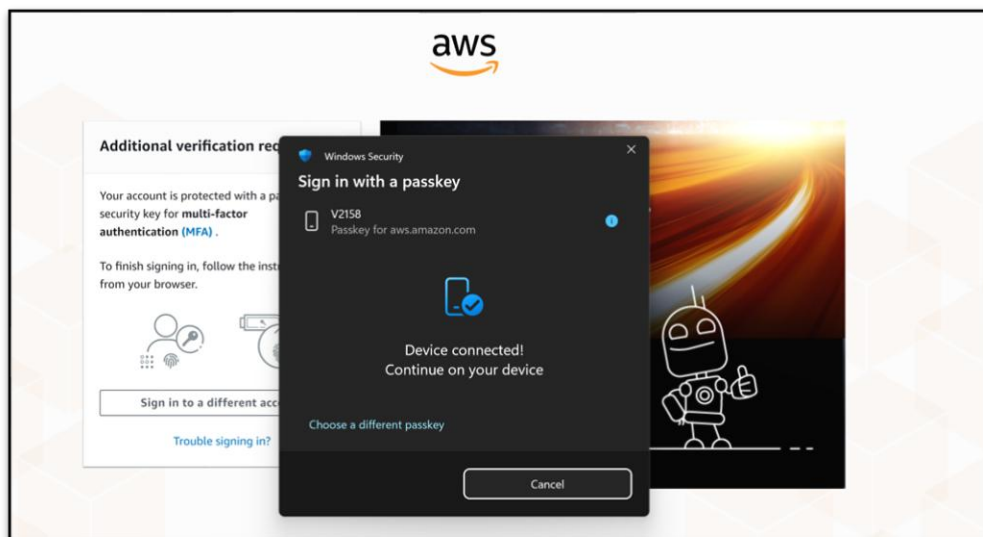

- **Select MFA device:** Enter the name→You can use the option of passkey, QR authentication or through hardware token→Next→Enter the passkey or any other authentication.

- The MFA has been successfully created.
- Whenever the IAM user logs in the MFA is required which can be either passkey, QR code or hardware token.

- ✓ **The IAM user has been created with Fullaccess to S3 services.**
- ✓ **Custom sign-in URL and MFA has been setup.**
